

White Paper

Introduction

TgAi is a new Telegram based Ai project with its own token (TGAI) on Base Chain. Our revolutionary Telegram based Ai technology allows users to create a range of different Ai Telegram bots many of which are customizable to your needs. TgAi allows Telegram Ai bots to be created without needing to worry about coding, storage or hosting needs, everything is taken care of by TgAi.

Product First

Unlike many tokenized projects TgAi will release its token only after our full working product is released. We feel it is vital for a project to have full working utility at the time of their token launch so that investors can be certain that our products fully work. Our product is live and can be used now.

Ai Technology

TgAi build on top of the latest OpenAi technology. OpenAi is one of the most advanced and up to date Ai technologies available to today. By utilizing this amazing base technology TgAi is able to build over the base model to produce quality Ai bots for users which are cutting edge within the Telegram bot world. As we use simply the best base you can always be rest assured that the Ai tech your bot will have is up to the task.

Telegram Integration

Telegram is a very popular social messaging platform with a great number of users and a range of features that allow for bot production. TgAi are experts in building Telegram bots and the use of Ai within them brings brilliant results. Our combination of Ai models and Telegram models provide the ultimate base for any user to create their own Ai Telegram bots.

Free Bot Advertising Strategy

Our free bots are designed to provide a great advertising outlet for TgAi. The bots will only run on channels with over 50 members and they all contain a certain level of TgAi advertising, even the image bots have in built TgAi lettering in many of the images.

As our business is largely Telegram based providing free bots with advertising for our product allows us to put our name in front of many potential users and token buyers. This specific type of targeted advertising will be a great asset with our project.

Ease of Use

The entire TgAi system is designed for ease of use and deployment by users. Users need no technical knowledge at all in order to produce an Ai Telegram bot for their own channel. With a few button clicks and the entry of some very basic information your bot will be up and running in no time. The system is designed for users of any experience. Having a system designed for ease of use will allow us to cater for a wide user range.

Atb Control System

The TgAi Atb control system is the heart of what allows us to produce and host users bots with ease. This system has been adapted from a control system created for another project and is designed to control all aspects of individual bot production, deployment and hosting. The bespoke system allows multiple users create and run bots as if they were hosted from a single server by the user. This system allows to run the the bot creation programs.

Chat Bots

TgAi allows you to create both generalized and crypto specific Ai chat bots both of which are customizable.

General Ai chat bots are Ai Telegram chat bots which can be customised to suit your needs. There are only 3 settings for users to set with these bots and you can control the bots personality, what role it has in your community and and what extra knowledge it has. With just these 3 settings you can create a bot for any topic or channel.

Crypto Ai chat bots have all the features of a general chat but they also come with certain crypto api integration to give them up to date knowledge such as your tokens current price or the top gainers in today's markets. These bots also provide for extra customization around your actual token / project.

Text to Image Bots

Tgai allows you to create 2 sorts of text to image bots.

A general image bot allows you to create a text to image bot for your channel where the images may contain the TgAi lettering in some minimal way in your images.

Custom image bots allow you to set your brand name or slogan to replace the TgAi wording base of your images . This allows users to produce image bots which produce images which are somewhat customized to their brand name or slogan instead of being customized for the TgAi name.

Crypto Specific Bots

Again we have two different types of crypto specific bots.

The first is an Ai uniswap new listings scanner. The Ai bot scans the blockchain for new listings on Uniswap. When it picks up new listings the Ai will analyses the results after conducting honeypot checks. The Ai bot displays the results in your Telegram channel. The bots are customizable in the way that you can set their personality.

The second crypto specific Ai bots which users can produce is an Ai check any token (on Ethereum) for security risks. The ai takes a token address as an input and conducts various checks ont eh token. The Ai bot then analyses all the information and displays the results in your channel. Users can ask the bot to check tokens by contract address. Again the personalit yof this can be set by users.

Base Chain

Base chain is a layer 2 Ethereum chain. TgAi has chosen this chain to release its token for a variety of reasons. The chain is Evm based which is a requirement of our project and whilst other evm chains are available this was selected as the best for our project. Base has high user interest, tvl and trade volume for tokenized projects. On top of this gas fees are cheap on this chain.

TgAi Token

The TgAi token is available on Uniswap on Base chain.

- Initial liquidity consisted of 85% of the TGAI tokens and ???? ETH.
- The remaining tokens are split with 5% set aside for marketing and 5% for each team member (total 10% team tokens).
- 3% buy tax.
- 3% sell tax.
- 50% of tokens used in the purchase of bots will be burned.
- Total Supply 1 Billion

Our Team

The TgAi team is made up of four main members. Each team member holds 5% of the total supply of the TGAI token.

1. Oddy – Marketing / Business
2. Paulbcodes – Developer
